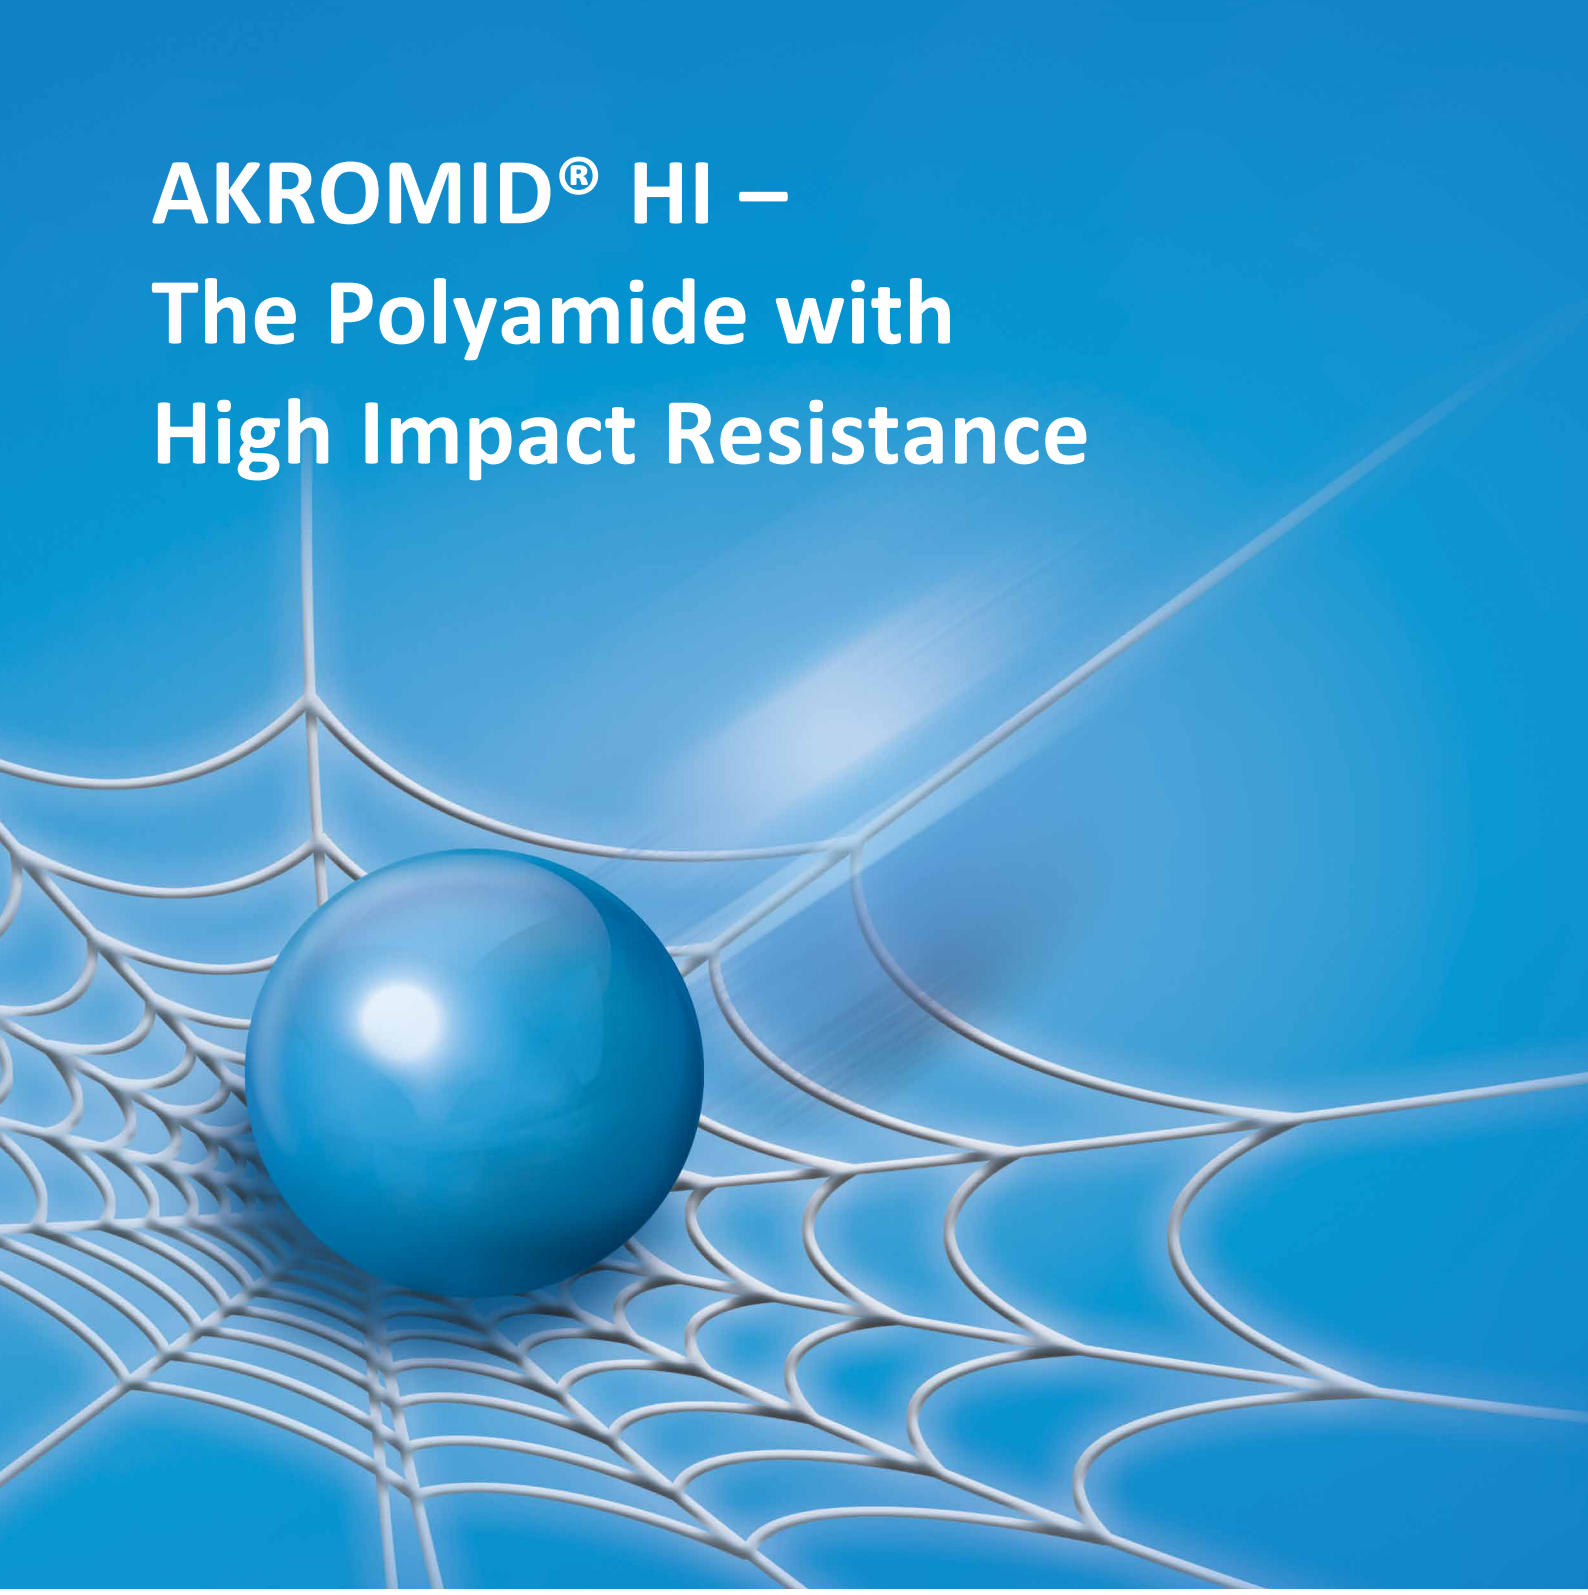
AKROMID® HI – The Polyamide with High Impact Resistance



AKRO-PLASTIC
Think Polyamide

AKRO-PLASTIC GmbH
Member of the Feddersen Group

High-Performance Materials – Impact-Modified AKROMID® Compounds

Polyamides are the largest product group of engineering plastics. They are typically used in engineering parts in the form of compounds. Alongside non-reinforced compounds, filled or reinforced compounds are used primarily to increase stiffness and strength.

It is known that the mechanical properties of thermoplastics are significantly influenced by environmental conditions. In addition to temperature, this includes water absorption and humidity, since components made from conditioned polyamides exhibit different strengths than freshly moulded parts. Thermoplastics are modified appropriately to perform under a wide range of ambient conditions.

AKRO-PLASTIC GmbH have developed a product range of impact-modified compounds for this purpose. These are suited specifically for applications which are exposed to harsh conditions. There are two types of **modified compounds: cold-impact-resistant (S1)** and **dry-impact-resistant (S3) compounds**. Non-reinforced and reinforced compounds with differing glass fibre content are available.

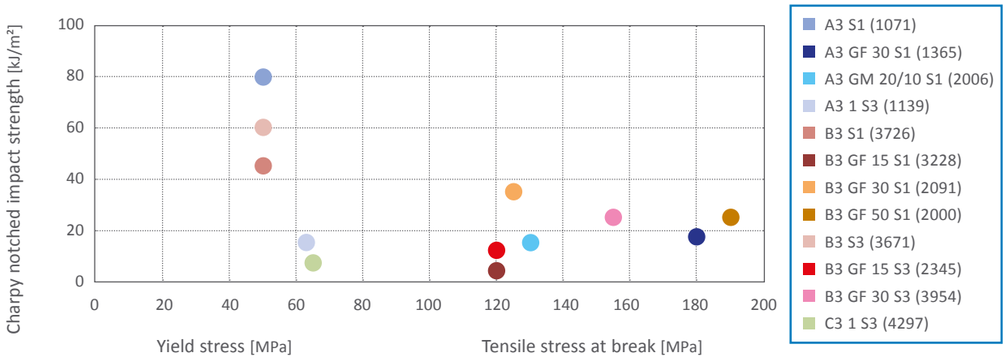
Product Characterisation

Notched Impact Strength through Yield Stress/Tensile Stress at Break

(Fig. 1)

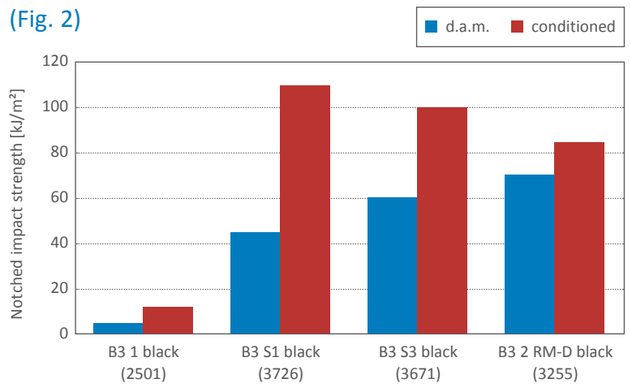


The requirements of the material to be used depend on the type of component. The optimal combination of strength and toughness can be formulated based on the composition of impact-modified compounds. Non-reinforced impact-modified compounds can exhibit extremely high impact strengths (see fig. 1). By contrast, the glass fibre grades in this product family are designed to provide a good balance of properties at significantly higher strengths.

As to be expected, impact strength increases at room temperature for all polyamide compounds in this overview as a result of conditioning. Dry impact resistant AKROMID® grades were developed for use in dry climates or as a way to avoid post conditioning steps. Thus in many cases, parts with snap-on connections can be clipped in immediately following injection moulding, which can accelerate the production process. AKROMID® B3 2 RM-D black (3255) – a special PA-ABS blend with good dry-impact properties – is an interesting alternative to conventional impact-modified compounds.

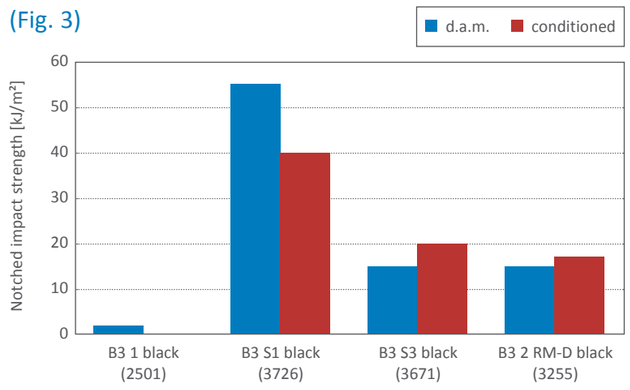
Notched Impact Strength at 23 °C

(Fig. 2)



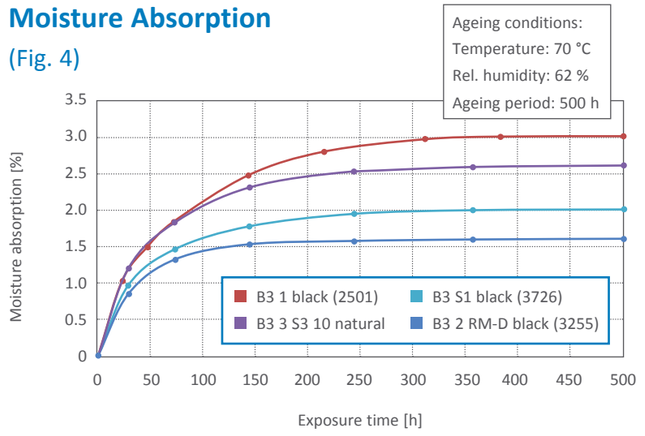
Notched Impact Strength at -30 °C

(Fig. 3)



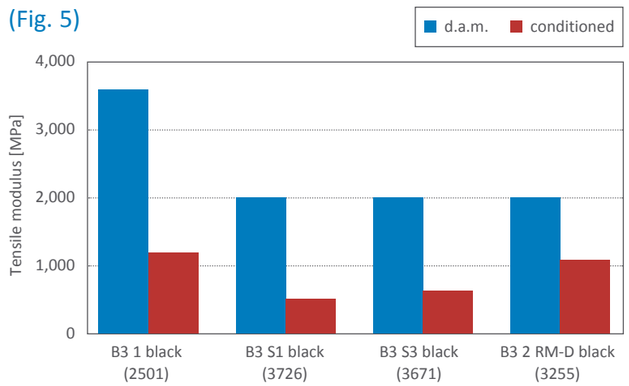
Moisture Absorption

(Fig. 4)



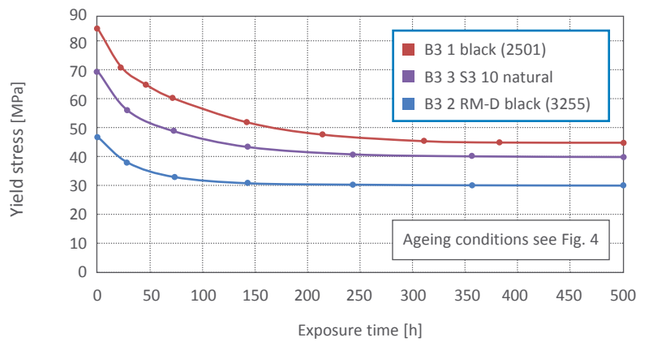
Tensile Modulus

(Fig. 5)



Yield Stress as a Function of Exposure Time

(Fig. 6)



The effect of conditioning is the lowest with the RM (reduced moisture) formulation (see AKROMID® RM brochure). A standard PA 6 B3 1 black (2501) was used as the reference product (see fig. 2).

However the impact strength in the conditioned material decreases at -30 °C. This is due to the complex interaction between the impact-strength modifier and the polymer matrix (see fig. 3).

It is in the nature of polyamides to absorb moisture. Conditioning changes not only toughness, but also strength. The greater the moisture absorption, the more dramatic it is. The impact-strength modifiers themselves absorb very little moisture, which is why moisture absorption and thus the effect of strength due to conditioning are lower in these compounds than in unmodified compounds (see fig. 4).

One of the advantages of AKROMID® B3 1 black (2501) is its greater stiffness when freshly moulded. With a reduction of the tensile modulus by more than 2 GPa, however, moisture absorption has a significantly greater effect than is the case in impact-modified compounds. This must be taken into account when designing parts (see fig. 5).

As can clearly be seen, the yield stress of AKROMID® B3 1 and AKROMID® B3 3 S3 10 natural is approximately the same when conditioned (see fig. 6).

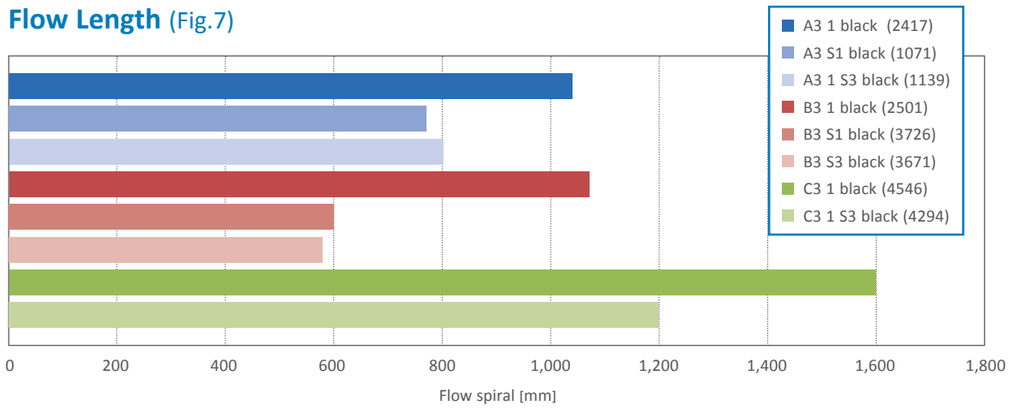
Processing Recommendations

In terms of processing, it must be noted that impact-modified compounds have a higher viscosity than standard polyamides. These different flow characteristics can be clearly evident in certain cases, as demonstrated by AKROMID® B3 S1 black (3726) and AKROMID® B3 S3 black (3671) (see fig. 7). It is generally possible, however, to formulate special compounds with favourable flow characteristics.

		AKROMID® A	AKROMID® B	AKROMID® C
Flange	ϑ_1	60–80 °C	60–80 °C	60–80 °C
Sector 1 – sector 4	ϑ_2	260–310 °C	220–300 °C	260–300 °C
Nozzle	ϑ_3	270–310 °C	230–300 °C	260–300 °C
Melt temperature	ϑ_4	280–310 °C	240–300 °C	270–300 °C
Mould temperature	ϑ_5	80–100 °C	80–100 °C	80–100 °C
Drying	ϑ_6	0–4 h	0–4 h	0–4 h
Holding pressure, spec.	P_{hold}	300–800 bar	300–800 bar	300–800 bar
Back pressure, spec.	P_{back}	50–150 bar	50–150 bar	50–100 bar

The specified values are for reference values. For increasing filling contents the higher values should be used.
For drying, we recommend using only dry air or a vacuum dryer. Processing moisture levels between 0.02 and 0.1 % are recommended.
For AKROMID® delivered in bags, no predrying is required when properly stored. It is recommended to use opened bags completely.
Material processed from silo or open boxes may have absorbed moisture and require a longer drying time.

Flow Length (Fig.7)



Applications

Impact-modified AKROMID® compounds are used in all industrial sectors.

Components for sports and leisure activities are frequently confronted with high forces or even impact loads. An interesting example is an ice skate from T-Blade, for which an impact-resistant AKROMID® was used to make the blade holder. The blade itself can be replaced with a new one as soon as it is worn out. The material meets the high standards of the component even at the low temperatures at work here.

Highly reinforced compounds are typically used as metal substitutes. Glazpart Ltd. (UK) have replaced a steel design with an intelligently developed plastic part made of a high-impact-modified AKROMID® compound which is used to protect a gas canister valve. It has passed all tests in the -40 °C to +65 °C range required for gas canisters with a gross weight of 100 kg.

In the automotive industry, typical applications include window frame trim, cable ducts, fasteners and housings which may be subjected to impact loads. In these cases, dry-impact-resistant compounds are frequently used to bypass the conditioning step during assembly. Because polyamides are significantly more brittle at low temperatures than at room temperature, cold-impact-modified compounds are used when the requirements call for this.

Valve guard for gas canisters, Glazpart Ltd. (UK): AKROMID® A3 S1 grey (4377)

The examples shown here are just a few of the possible applications. We will be happy to discuss further specific applications personally with you.

Ice skate blade holder, T-Blade: AKROMID® B3 GF 30 S1 black (2091)

Application Areas

Automotive Industry
- Airbag clips
- Airbag housings
- Aerial housings
- Fastening clips
- Seat add-on parts
- Belt guides/holders
- Cable ducts
- Fan blades

Electric/Electronic
- CEE plugs
- Electrical plugs
- Housing parts
- Cable ties

Industry
- Dowels
- Cable ties
- Chain drives
- Valve guard for gas canisters
- Furniture fittings
- Tool parts
- Pump housings

Sports
- Ice skate blade holders
- Ski binding parts
- Parts for inline skates

We Will Be Pleased to Meet You!
